Summary

The information carriers 1 allocate confidence values 2 for which figures are exemplarily shown in Figure 1 to sets of criteria 3 according to their preferences. In this respect, each information carrier 1 can allocate a certain number of confidence values 2. These sets of criteria are associated with options 4 wherein each option 4 can belong to several sets of criteria 3. Due to a selection procedure 5 which transfers the confidence values 2 to the options 4, the options 4 having the highest number of confidence values 2 are selected and allocated to the targets 7. These targets 7 form the panel 6. The work of the panel 6 leads to results 8. These results 8 are reevaluated by the information carriers 1. According to the satisfaction of the information carriers 1 with the results 8 the confidence values 2 can be newly allocated.
